Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato mottle virus, tomato yellow leaf curl virus or bean golden mosaic

This DNA sequence comprises a transdominant lethal mutant, designated TOMOV-ACIdlm, of the ACI gene of tomato mottle virus virus (TOMOV). It encodes an ACI protein (see AAW34324) that carries mutations in its NTP-binding domains. The ACI gene (see also AAT93294) must be expressed for efficient replication of the two genomic components, DNA-A and DNA-B, of the bipartite TOMOV genome. The invention involves production of transgenic plants containing DNA comprising geminivirus ACI or CI wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The ACI/CI genes are especially from TOMOV, tomato yellow lasf curl virus or bean golden mosaic geminivirus (see AAT93282-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding

Claim 11; Page 72-73; 132pp; English.

This DNA sequence comprises a mutated AC1 gene of tomato mottle virus (TOMOV). It carries an inserted 4-base Sau3A site that shifts the AC1 gene translation reading frame resulting in the expression of a truncated AC1 protein (see AAW3427). The AC1 gene (see also AAT93294) must be expressed for efficient replication of the two genomic components, DNA-A and DNA-B, of the bipartite TOMOV genome. The invention involves production of transgenic plants containing DNA comprising geminivirus AC1 or C1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from TOMOV, tomato yellow lasf curl virus or bean golden mosaic geminivirus (see AAT93282-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding

Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato motile virus, tomato yellow leaf curl virus or bean golden mosaic

Claim 11; Page 75; 132pp; English

This DNA sequence comprises the complete AC2 and AC3 coding sequences and CC the C-terminal two-thirds of the AC1 open reading frame (see also AT93924) of tomato mosaic virus (TOMOV). It was obtained by ligating a BamHI-HindIII fragment of a binary plasmid composed of a dimer of the full-length, infectious TOMOV A-component with BamHI-HindIII-digested pJTS222, inserting a BamHI-HindIII ragment of this construct into pBluescript II KS+, and digesting with BgII and SphI. The AC1 gene must be expressed for efficient replication of the two genomic components, DNA can be appeared for efficient replication of the two genomic components, DNA can be constructed by a fine bipartite TOMOV genome. The invention involves production of transgenic plants containing DNA comprising geminivirus AC1 or C1 wild-type or mutant sequences that negatively interfere in transfer with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from TOMOV, tomato yellow leaf curl virus or bean golden mosaic geminivirus (see AAT93282-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding componence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This genomic DNA sequence includes the open reading frame (ORF) of the wild-type C1 gene of bean golden mosaic virus (BGMV), a geminivirus that has a monopartite genome. The C1 protein (see AAM34338) is required for replication. The wild-type C1 portein (see AAM34338) is required for containing DNA comprising C1 or AC1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from BGMV, tomato mottle virus or tomato yellow leaf curl virus (see AAM33282-33) and encode polypeptides (see AAM34324-35) that have mutations in the highly conserved DNA-nicking domain and/or the NTP-binding domains.                 The present sequence is a 35S-rep gene cassette comprising the rep gene of bean golden mosaic virus (BGNV)-GA cloned downstream of the CaNV 35S promoter and an alfalfa mosaic virus (AMV) leader sequence. The sequence was integrated into pBSII-KS+ to produce a rep gene expression vector. DNA-nicking domain mutations may be incorporated into rep gene to produce a genetic construct that acts as a trans-dominant inhibitor of geminiviral replication. When expressed in a plant cell, this inhibitor is able to dramatically reduce replication of geminivirus. Genetic constructs that include sequences containing a portion of the ac3 gene in addition to the trans-dominant inhibitor exhibit increased efficiency and broadened specificity of inhibition of geminivirus replication. Geminiviruses are one of the greatest constraints on production of important crops, including cassava, beans, compass, peppers, tomatoes and cotton. The effects of the virus can be overcome by using the genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Geminivirus; DNA-A; geminivirus replication inhibition; ac3 gene; transgenic plant; antiviral; gene therapy; bean golden mosaic vir BGMV; alfalfa mosaic virus; AMV; cauliflower mosaic virus; CaMV;
                                                                                                                                                                                                                                                                                                                                                                                             Genetic construct comprising a mutant geminiviral rep gene, producing a plant resistant to geminiviral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bean golden mosaic virus.

                                                                                                                                                                                                                                                                             The present sequence is pTrep23deltaE/CX. It contains a mutated geminivirus rep gene sequence. Genetic constructs containing DNA-nicking domain mutants in the rep gene may be used as trans-dominant inhibitors of geminiviral replication. When expressed in a plant cell, these inhibitors are able to dramatically reduce replication of geminivirus. Genetic constructs that include sequences containing a portion of the acl gene in addition to the trans-dominant inhibitor exhibit increased efficiency and broadened specificity of inhibition of geminiviral replication. Geminiviruses are one production of important crops, including cassava, beans, cowpeas, peppers, tomatoes and cotton. The effects of the virus can be overcome by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Genetic construct comprising a mutant geminiviral rep gene, useful for producing a plant resistant to geminiviral infection.

Genetic constructs containing DNA-nicking domain mutants in the rep gene may be used as trans-dominant inhibitors of geminiviral replication. When expressed in a plant cell, these inhibitors are able to dramatically reduce replication of geminivirus. Genetic constructs that include sequences containing a portion of the ac3 gene in addition to the trans-dominant inhibitor exhibit increased efficiency and broadened specificity of inhibition of geminivirus are one of the greatest constraints on production of Geminiviruses are one of the greatest constraints on production of important crops, including cassava, beans, cowpeas, peppers, tomatoes and cotton. The effects of the virus can be overcome by using the genetic

It was obtained by Kunkel mutagenesis of the wild-type C1 gene (see AAT93314). C1 is required for replication. The invention involves production of transgenic plants containing DNA comprising geminivirus C1 or AC1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from BGMV, tomato mottle virus or tomato yellow leaf curl virus (see AAT93282-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding domains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bean golden mosaic virus.
Cauliflower mosaic virus.
Alfalfa mosaic virus
The present sequence is pTrepN, a vector containing a CaMV-35S promoter-driven rep gene derived from bean golden mosaic virus (BGNV)-GA. Sitedirected mutagenesis was used to engineer an Ncol site in the start codo of the rep gene to facilitate cloning of DNA-nicking domain mutants. The resulting genetic constructs act as trans-dominant inhibitors of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Geminivirus; DNA-A; geminivirus replication inhibition; ac3 gene; transgenic plant; antiviral; gene therapy; bean golden mosaic virus; BGMV; alfalfa mosaic virus; AMV; cauliflower mosaic virus; CAMV; ds.
                                                                                                                                                                                                                                       Genetic construct comprising a mutant geminiviral rep producing a plant resistant to geminiviral infection.

When expressed in a plant cell, these inhibitors are able to dramatically reduce replication of geminivirus. Genetic constructs that include sequences containing a portion of the ac3 gene in addition to the trans-dominant inhibitor exhibit increased efficiency and broadened specificity of inhibition of geminiviral replication. Geminiviruses are one of the greatest constraints on production of important crops, including cassava, beans, cowpeas, peppers, tomatoes and cotton. The effects of the virus can be overcome by using the genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 1651 BP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  닭
                                                    This DNA sequence comprises construct BGAC221 that codes for a transdominant lethal mutant (see AAW3433) of the C1 protein (see AAW34338) of bean golden mosaic virus (BGMV). It was obtained by Kunkel mutagenesis of the wild-type C1 gene (see AAT93314). C1 is required for replication. The invention involves production of transgenic plants containing DNA comprising geminivirus C1 or AC1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from BGMV, tomato mottle virus or tomato yellow leaf curl virus (see AAF93282-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding domains. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato mottle virus, tomato yellow leaf curl virus or bean golden mosaic

                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This DNA sequence comprises construct BGAC228 that codes for a transdominant lethal mutant (see AAW34334) of the C1 protein (see AAW34338) of bean golden mosaic virus (BGMV). It was obtained by Kunkel mutagenesis of the wild-type C1 gene (see AAT93314). C1 is required for replication. The invention involves production of transgenic plants containing DNA comprising geminivirus C1 or AC1 wild-type or mutant sequences that negatively interfere in trans with geminiviral replication during infection. Such transgenic plants are resistant to viral infection. The AC1/C1 genes are especially from BGMV, tomato mottle virus or tomato yellow leaf curl virus (see AAT93382-93) and encode polypeptides (see AAW34324-35) that have mutations in the highly conserved DNA-nicking and/or the NTP-binding domains. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transgenic plants expressing geminivirus AC1 and C1 wild-type and mutant genes - have increased resistance to geminivirus infection e.g. tomato mottle virus, tomato yellow leaf curl virus or bean golden mosaic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score
